Industrial Internship Report

Banking Information System (Python)

Student

Name: Nagulan.R

Executive Summary

This report presents a Python-based Banking Information System that allows users to create accounts, deposit money, withdraw money, check balances, and display account details using a console interface.

Objective

Develop a simple banking application demonstrating Python programming, object-oriented programming, and input validation.

Problem Statement

Banks require a basic system to manage customer accounts and transactions efficiently.

Software Requirements

Python 3.x, VS Code/IDLE, Windows/Linux.

Implementation

The application uses a BankAccount class with methods for deposit, withdrawal, balance checking, and account display. A dictionary stores accounts during program execution.

Testing

Verified account creation, deposits, withdrawals, invalid input handling, insufficient balance checks, and balance display.

Learning Outcomes

Improved understanding of Python classes, functions, loops, conditionals, dictionaries, and user interaction.

Future Scope

Add MySQL database, login authentication, GUI using Tkinter, transaction history, and fund transfer.
